

# Pelletheart

A prototype of a hybrid rule reasoner for ontologies.

## Description

Integrating classic forward chaining rule reasoning implemented by [HeaRT](#) with the [Pellet](#).

Concept by G. J. Nalepa and W. T. Adrian (de domo Furmańska), prototype implementation by W. T. Adrian.

## Idea

- **Conceptual level:** Integration of *Attribute Logic with Set Values over Finite Domains* (ALSV(FD)) and *Description Logics (DL)* (research paper on integration: [read](#))
- **Implementation level:** Integration of Pellet ontology reasoner and HeaRT rule inference engine (research paper on architecture proposal: [read](#), poster:

See [LNCS/LNAI 6359/2010 Paper: Pellet-HeaRT – Proposal of an Architecture for Ontology Systems with Rules \(2010\)](#).

It is based on the DAAL concept, see [Springer SCI vol. 244/2009 Paper: Proposal of a New Rule-Based Inference Scheme for the Semantic Web Applications \(2009\)](#) and [TCCI II, LNCS/LNAI 6450/2010 Paper: Integration Proposal for Description Logic and Attributive Logic – Towards Semantic Web Rules \(2010\)](#).

## Integration Proposal

- Attributes in AL correspond to Concepts in DL
- model of a system stored in HeaRT, rule conditions checked by Pellet, execution of rules by HeaRT
- communication: DIG or command line

## Implementation

### Top-down overview

There are 2 aspects of the integration of Pellet and HeaRT:

1. Communication channel
  1. command line
    1. sending RDF/XML (dedicated translators from HML/R to RDF/XML)
  2. DIG interface
    1. sending DIG message (dedicated translators HML/R to DIG)

## 2. Inference scenario

1. rule precondition checked with *consistency checking* DL task
2. rule precondition checked with *realisation* DL task

## What has been done

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% Reasoning with HearT-Pellet:                                     %
% 1. Build TBox: definitions of types and attributes                %
%   a) build additional statements: 'allDifferent' for individuals %
% 2. Call any inference mode you wish (GDI, TDI etc.)            %
% 3. In each state build an ABox representing this state          %
% 4. Whenever you check a rule preconditions:                     %
%   a) build rule axioms (temporary TBox),                       %
%   b) ontology = definitions TBox + rule axioms TBox + state ABox %
%   c) send the ontology to Pellet to check its consistency       %
% 5. Interpret the result, carry on as usual                      %
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% Reasoning with HearT-Pellet - Alternative version:              %
%                                                                    %
% 1. Build TBox: definitions of types and attributes                %
%   a) build additional statements: 'allDifferent' for individuals %
% 2. Call any inference mode you wish                             %
% 3. In each state build an ABox representing this state          %
% 4. Whenever you check a rule preconditions:                     %
%   a) build rule axioms (ABox statements)                        %
%   b) definitions TBox + rule axioms aBox + state ABox          %
%   c) send to Pellet to check realization the rule conditions    %
% 5. Interpret the result, carry on as usual                      %
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

```

Following the inference scenario:

### 1. HearT can be started with additional parameter in the gox predicate:

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% gox(StateIn,T,Mode,ExternalReasoner)                            %
%   ExternalReasoner - the one used to check the rules preconditions %
%                                                                    %
% Augmented version of Heart - additional variable for an ext.reasoner %
%                                                                    %
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

```

### 2. Translating parts of the HMR model to RDF/XML

```

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% DAAL prototype translator.
% -----

```

```
%
% Translates attributes into concepts,
% attribute values into instances and
% rule preconditions into T-Box like axioms.
%
% Supported operators: 'in', 'eq'.
% Supported attributes: 'symbolic'.
%
% Basic predicates:
% owl_xml_gen/0 - translate HMR file into DAAL representation (ontology).
% owl_xml_gen/1 - translate HMR file into DAAL representation (ontology)
%                   and write it to the file given as the argument.
% owl_attr_gen/0 - translate the attribute definitions
% owl_rulp_gen/0 - translate the rules preconditions
% owl_rulp_gen/1 - translate the given rule preconditions
% owl_stat_gen/0 - translate the states statements
% owl_stat_gen/1 - translate the given state statement
%
```

### 3. Sending partial ontologies from HeaRT to Pellet

### 4. Interpreting the Pellet answers by HeaRT

#### Technically

- `heart-pellet.pl` - Extended version of HeaRT (works with the standard HeaRT distribution): additional parameter in `gox` predicates for the external reasoner to use
- `heart-daal-translator.pl` - predicates
